

Phase-6: System Verification & Quality Assurance

Project: Auto Ticket Classification using Flow Designer | Target: u_incident_workflow | Scope: Global

6.1 Unit Test Execution Matrix

Each operational branch was formally verified by submitting ticket records via the UI and evaluating database mutations and execution contexts:

Test ID	Test Input (Short Desc)	Caller Profile	Auto Assigned Output	Email Dispatched	Result
TC-01	My college Has issue with Network	Alfonso Onglen	Network / Wi-Fi	Yes (SMTP)	PASS
TC-02	Projector not turning on	Sam Sorokin	Hardware / Projector	Yes (SMTP)	PASS
TC-03	Forgot password for student portal	Eliseo Wice	Access / Forgot Password	Yes (SMTP)	PASS
TC-04	Slow computer in laboratory 2	Savannah Kesich	Performance / Slow Computer	Yes (SMTP)	PASS
TC-05	General facility lighting inquiry	Admin User	Remains Blank (Unassigned)	Yes (SMTP)	PASS

6.2 Outbound SMTP Log Audit

Navigate to **System Logs** → **Emails** and filter on Subject contains "Your Request for the issue has been submitted."

Verification confirms:

- Message headers correctly reflect target recipients (savannah.kesich@example.com, eliseo.wice@example.com, etc.).
- Dispatch status is set to send-ready via SMTP.
- Outbound body contains the standard acknowledgment message with authentic watermark tracking codes.

Quality Sign-Off: All 5 unit test scenarios executed successfully with zero runtime execution errors or recursive trigger loops.
